

ADRIEN PONCE

ASPIRING SOFTWARE DEVELOPER

SUMMARY

I am a computer science graduate looking to utilize the skills I have learned in my academic experience. I excel in the development of Python, Java, and C, while also being proficient in SQL querying. I am seeking entry-level full-time jobs within the domain of software development and information technology. I am driven to continuously and tenaciously expand my skill set, while also exploring emerging technologies in order to deliver innovative solutions to emerging problems. I consistently meet deadlines with precision and am eager to contribute my aptitudes.

SKILLS

- Python
- Flask
- Ruby
- C
- JavaScript
- SQL
- Git
- Java
- Jinja
- Ruby
- Microsoft 365
- File Systems
- Problem Solver
- Punctual
- Critical Thinker
- Automotive Literacy

EDUCATION

High School Diploma

Culpeper County High School • 2015–2019

Bachelor of Science in Computer Science

James Madison University • 2019–2023

LANGUAGES

- English - Native
- Spanish - Intermediate

PROJECT EXPERIENCE

Asteroids App

- Built a web based Asteroids arcade game using JavaScript and the HTML Canvas API, featuring a vector based physics system with accurate collision detection
- Used ES6 modules and class based entity management to separate the core game logic from the rendering loop
- Implemented an optimized game loop with garbage collection to maintain stable frame rates and manage entity states during infinitely scaling waves of asteroids
- Designed a custom 2D vector math library from scratch to handle entity velocity, trigonometric rotations, and precise movement mechanics

Blackjack App

- Built a Python/Flask Blackjack web app featuring mechanics like splitting, doubling down, and accurate payout handling
- Separated core game logic from the frontend presentation layer using Flask routing and modular design
- Utilized Jinja2 templating to dynamically inject real time game data and immediate hand states into the UI
- Designed as a sandbox, managing wager logic and state transitions via Flask session instead of a database

CLI Blackjack

- Built a single-deck Blackjack game in Python with full gameplay logic including splitting, doubling down, insurance, and accurate payout handling
- Used dataclasses and modular design to separate game logic from the CLI interface
- Implemented JSON based persistence to maintain player state across sessions
